

Practitioner-Only, Precision Probiotics

FOR PROFESSIONAL REFERENCE ONLY

Activated Probiotics is a range of targeted probiotic supplements backed by double-blind, placebo-controlled human clinical trials. Each product has been formulated to address specific needs of patients under the guidance of a healthcare practitioner.

Practitioner partner benefits

- Innovative products
- Targeted formulations
- Expert training support

ACTIVATED PROBIOTICS ARE

Clinically Studied

Our range includes complete product formulations and specific probiotic strains which are backed by a high level of clinical evidence. Results from human clinical trials support each of our Activated Probiotics products.

Strain Specific

Each of our products are formulated with specific probiotic strains to provide targeted health benefits. Different probiotic strains do different things — in fact, the genetic difference between two strains can be as significant as the difference between a human and a lemur.

Shelf Stable

Our Live Probiotic Promise™ guarantees our products will contain the number of live probiotic microorganisms as stated on the label, at a minimum, up until expiry. We make impactful choices in our manufacturing and packaging processes such as freeze-drying and blister packaging to ensure this.

Microencapsulated

Microbac™ microencapsulation is used in many of our products to protect individual bacterium against the damaging effects of stomach acid, allowing up to 5x more probiotic bacteria to survive and reach the gut alive.

Educators

We're dedicated to supporting practitioners in delivering the best possible care to patients. Alongside our practitioner-only range of probiotics, we prioritise high quality educational resources that will assist our community of practitioners in making evidence-based selections for their patients.

***Limosilactobacillus fermentum* LF10**
***Lactobacillus acidophilus* LA02**

In women diagnosed with recurrent vulvovaginal candidiasis who administered *L. fermentum* LF10 and *L. acidophilus* LA02 on alternate days for 10 consecutive nights followed by once a week for 10 weeks, only 28% experienced recurrence across the duration of the study. This is substantially lower than the recurrence rates following standard antifungal treatment (up to 57% recurrence).

***Ligilactobacillus salivarius* LS03**
***Bifidobacterium breve* BR03**
***Lactaseibacillus casei* LC03**

In a double-blind, randomised, placebo-controlled trial, participants with acne who were administered a combination of *L. salivarius* LS03, *B. breve* BR03 and *L. casei* LC03 once daily for 8 weeks experienced a 31% reduction in the number of acne lesions after 4 weeks with a 39% reduction at the end of the 8 week study ($p < 0.05$).

***Lactaseibacillus rhamnosus* GG**

A randomised controlled trial involving 123 adults with IBS found that 6 weeks of treatment with *L. rhamnosus* GG reduced the average IBS symptom severity score by 76% which was statistically significant when compared to control ($p < 0.01$).
